iWet: The Intelligent WRF Ensemble Tool

Leveraging deep learning hyperparameter tuning frameworks

Meteorology and Climate - Modeling for Air Quality

UC Davis Conference Center • September 11-13, 2019

Data Assimilation & Inverse Modeling

Derek Jensen, Donald Lucas, Clifford Anderson-Bergman, Sonia Wharton

LLNL-PRES-789577 This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract DE-AC52-07NA27344. Lawrence Livermore National Security, LLC

Ensembles <u>can</u> be great

- Ensemble Benefits
 - 1. Often provide more accurate forecasts
 - 2. Quantify uncertainty
- Ensembles seek to diagnose error due to
 - 1. Imperfect initial conditions
 - 2. Model imperfections

Types of Ensembles

- Initial Conditions
- Boundary Conditions (For local-area models)
- Observational Data Assimilation
- Multi-model
- Multi-physics
- Perturbed Physics
- Ensemble Challenges
 - Easy to design impossibly large ensembles
 - Junk ensemble members artificially inflate uncertainty
 - Unsampled sources of uncertainty create false confidence
 - Expensive to run and post process

Example Hurricane Spaghetti Plot https://doi.org/10.1002/wcc.187

Intelligent WRF Ensemble Tool Wishlist

Automate entire WRF workflow

- Download met data
- Generate directory structure
- Minimize duplicate work
- Parallel where possible
- Support restarts
- Convenient for single runs

• WRF Version agnostic

Modifies user-specified namelist templates

Lightweight

Single input deck

Parameter Sampling

- Run all combinations
- Randomly sample subset
- Intelligently select trials
- Early stopping for low-performing trials

Address Ensemble Challenges

- Handle large, multi-dimensional ensembles
- Prevent junk ensemble members
- Sample many sources of uncertainty
- Easy to run and post process

WRF model workflow

The WRF Ensemble Tool (Wet) is a Good Start

Automate entire WRF workflow

- Download met data
- Minimize duplicate work
- − Parallel where possible ✓
- Support restarts
- Convenient for single runs \checkmark
- WRF Version agnostic

Lightweight

Single input deck

Parameter Sampling

- Run all combinations
- Randomly sample subset
- Intelligently select trials ×
- Early stopping for low-performing trials X

Address Ensemble Challenges

- Handle large, multi-dimensional ensembles
- Prevent junk ensemble members
- Sample many sources of uncertainty
- Easy to run ✓ and post process X

4-member Wet ensemble validated against radiosonde obs.

```
WRF_NAMELIST_CHANGES = pd.Series(
    ('time_control', 'run_days'): "0, ",
    ('time_control', 'run_hours'): "12, ",
    ('physics', 'mp_physics'): ['1', '2',],
    ('physics', 'bl_pbl_physics'): ['1', '2'], })
```

Tuning ML Models is Analogous to "Tuning" Ensembles

- ML performance depends on proper hyperparameter tuning
- Common Tunable ML Hyperparameters

Ugh

Wet

iWet

I Wish

- Hidden Layers and Units
- Regularization
- Training Strategy
- Etc.
- Tuning Methods
 - Manual Search *
 - Grid/Random Search ←
 - Bayesian Optimization
 - Early Stopping
 - Reinforcement Learning

Sample Hyperparameters for a fullyconnected DNN that accepts 5 inputs and returns 2 predictions

Intelligent Search – Bayesian Optimization

- Sequential Model-Based Optimization [1]
 - Sequentially fits a probabilistic surrogate model to samples of an unknown objective function
 - An acquisition function chooses the next set of hyperparameters

| Aspects of SMBO | ML Tuning | WRF Ensemble | | | |
|-------------------------|---------------------------|---------------------------|--|--|--|
| 1. Parameter Space | n. layers, dropout, etc. | ICBC, DAS, MP, SP | | | |
| 2. Objective Function | ML Training | Running WRF | | | |
| 3. Surrogate Model | e.g. Gaussian Process | e.g. Gaussian Process | | | |
| 4. Acquisition Function | e.g. Expected Improvement | e.g. Expected Improvement | | | |
| 5. Performance History | \checkmark | \checkmark | | | |

(top left) Example of the unknown objective function and surrogate model and (top right) acquisition function [2] (bottom) Example of SMBO convergence [3]

Intelligent Scheduling – Early Stopping

 Hyperband Early Stopping: Focus on hyperparameter *evaluation*, not *selection* to optimize your compute resources [3]

- A bandit-based approach to optimization
 - Online algorithm to maximize return on investment. Which slot machine should the gambler play? [4]

 Li et al. reports that intelligent scheduling beats intelligent search

Example of scheduling methods like early stopping [3]

[3] Li, Lisha, et al. "Hyperband: a novel bandit-based approach to hyperparameter optimization." The Journal of Machine Learning Research 18.1 (2017): 6765-6816.
[4] Davidson-Pilon, Cameron. Bayesian methods for hackers: probabilistic programming and Bayesian inference. Addison-Wesley Professional, 2015.

Ray Tune Scales Intelligent Search & Scheduling

- Ray is a fast and simple framework for building and running distributed applications [5]
 - Multi node parallelization
 - Graceful error handling
 - Efficiently handles large objects
 - Easy to implement with a single Python decorator @ray.remote
 - Includes several ML libraries

[5] Moritz et al., "Ray: A Distributed Framework for Emerging AI Applications" arXiv:1712.05889v2
[6] Liaw et al., "Tune: A Research Platform for Distributed Model Selection and Training" arXiv preprint arXiv:1807.05118, 2018

Tune is a Ray library for

hyperparameter tuning at any scale [6]

- Pair a Search algorithm with a scheduler
- Search Algorithms:
 - Random Search
 - HyperOpt*
 - Nevergrad
 - Scikit-Optimize
- Schedulers
 - Population Based Training
 - Hyperband*
 - Median Stopping Rule

What is an appropriate tuning reward??

- An execution of a WRF trial and subsequent reward/cost calculation constitute an evaluation of the objective function to be maximized/minimized
- The user needs to define an appropriate cost/reward
- One Idea: Utilize U. Wyoming's Weather Web API
- iWet will automatically download specified radiosonde sites and compute mean-absolute error

| <pre># http://weather.uwyo.edu/upperair/sounding.html</pre> | | | | | | | | |
|---|----------|------------------|------------|--|--|--|--|--|
| # | (name, | region, | id) | | | | | |
| sonde_sites = | [('BNA', | '72493', | 'naconf'), | | | | | |
| | ('BMX', | '72230', | 'naconf'), | | | | | |
| | ('JAX', | '72206' , | 'naconf')] | | | | | |

| | |

| Region | Type of plot | | Year | Month | From | То | Station Number | |
|-----------------|--------------|---|--------|-------|----------|----------|-------------------|--|
| North America V | Text: List | ¥ | 2019 • | Aug 🔻 | 30/12Z V | 30/12Z V | 72672 | |

Click on the image to request a sounding at that location or enter the station number above.

A very hasty "Hello, World!"

- Default WRF 4.0 namelist settings
- Ensemble Parameters:

| Parameter | Values |
|-----------------|----------------|
| Met | ECMWF, GFS |
| Surface Physics | YSU, MYJ, QNSE |
| Micro Physics | Options 0 – 4 |

- 2 * 3 * 5 = 30 Possible Combinations
- 15 Trials
- Allocate 1 CPU per WRF Run
- Calculate reward every 12 hours of model time

WPS Domain Configuration

Trivial example but iWet appears to work

• The top-5 Trials

Conclusions

- Wet automates the entire WRF workflow and can brute force ensembles
- By utilizing libraries developed for neural network tuning, we made Wet intelligent
- There is still some cleaning and scaling to address but we hope to release iWet soon
- We are in the process of developing more interesting studies
