

MAC-MAQ Conference
11 September 2019
Davis, CA

Diagnosing Errors in Boundary Layer Structure

Robert Fovell

University at Albany

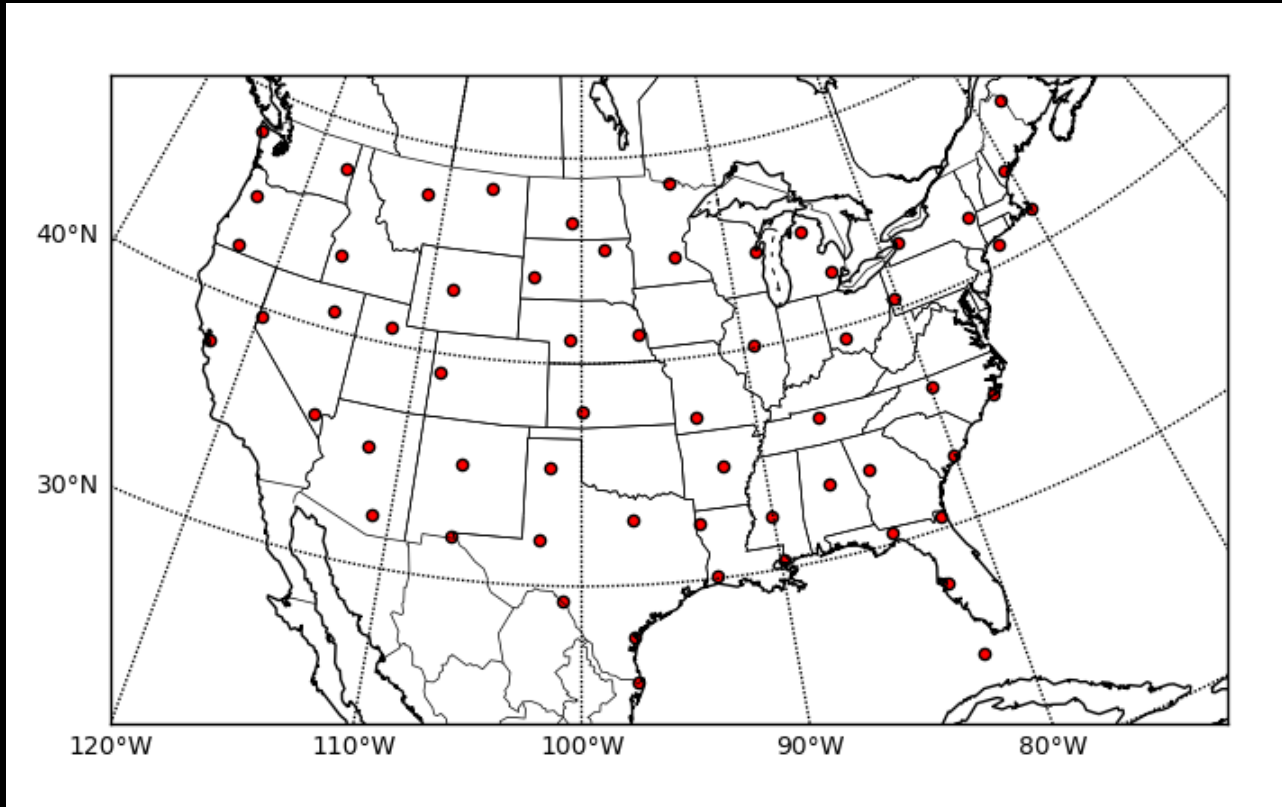

rfovell@albany.edu

Available surface stations

Includes low quality stations (cf. Fovell and Gallagher 2018)

Available high-frequency radiosondes

N = 60

Much fewer observations
Only twice per day
Much more difficult to handle
Archive is degrading

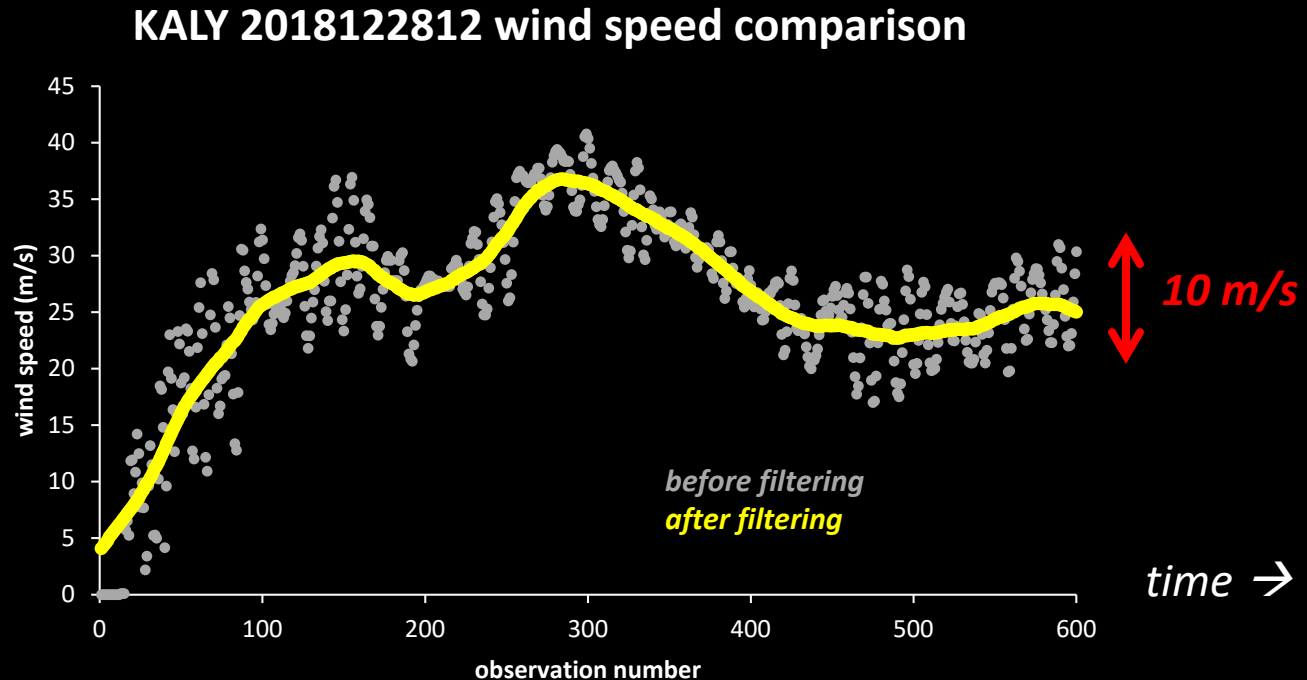

Analysis

- Operational HRRR analyses and forecasts on native model levels (NCEP) [“better”]
- High-frequency radiosonde observations (NCEI)
 - 1-second obs $\sim O(10 \text{ m}) \Delta z$
 - Archive incomplete and degrading
- Interpolated obs to HRRR model levels @ each site and time, then averaged over both
- Focus: first 24 h from 00Z and 12Z model runs
- Some results for April to June 2019

Challenges (partial list)

- Station ground height AGL needs to be determined
- Discrepancies exist between actual and HRRR elevations
- Non-standard release and barometer placement heights (worst offender: Albany, NY)
- Pressure- and GPS-derived heights MSL do not agree
- Pendular motion necessitates filtering
- Pre-launch data need to be removed
- **80% of launches ≥ 50 min prior to nominal times (00Z, 12Z)** [Coniglio et al. 2013; Evans et al. 2018]
 - Compare to 24 h *and* 23 h forecasts

Raw vs. filtered wind speeds - example

Expectation:
All of these issues will average themselves out
over space and time

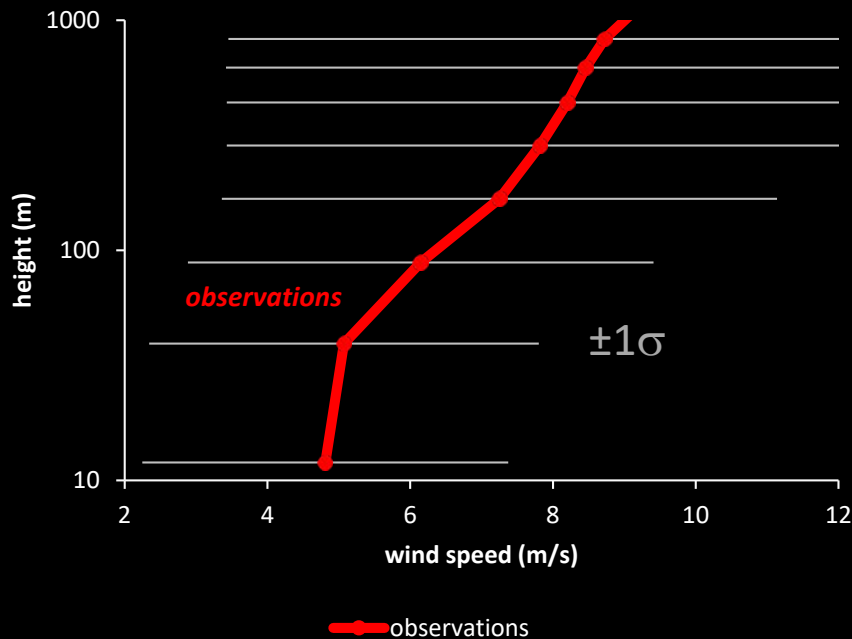

Raw vs. filtered wind speeds - example

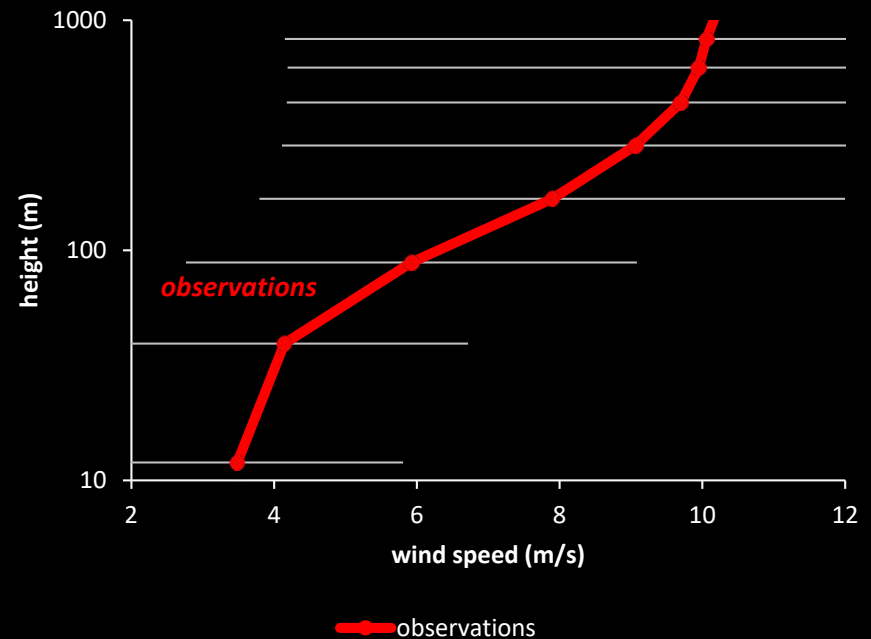

Need to identify and remove pre-launch data

Vertical profile of wind at 60 radiosonde sites: April 2019

HRRR 00Z wind profiles

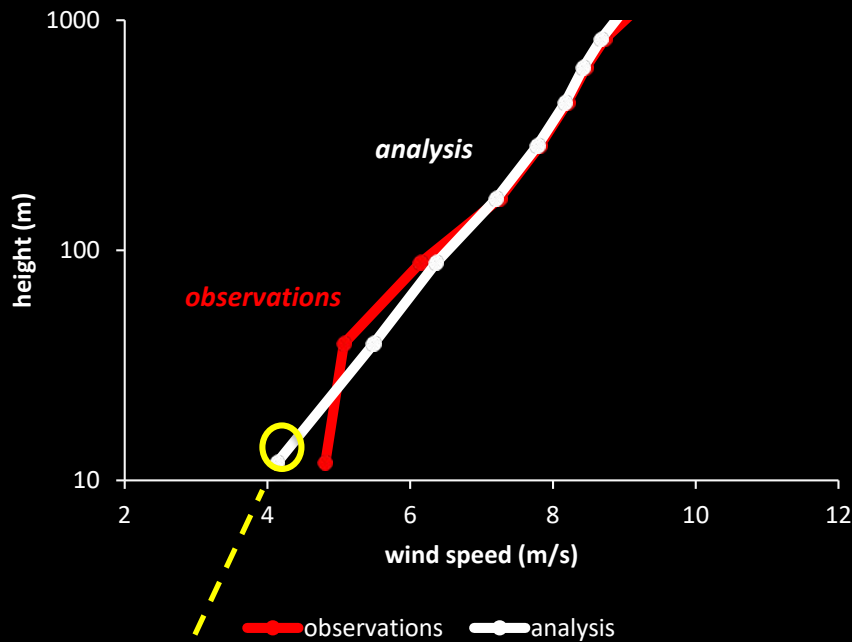

HRRR 12Z wind profiles

“Kink” in observations is very persistent but may be artifact

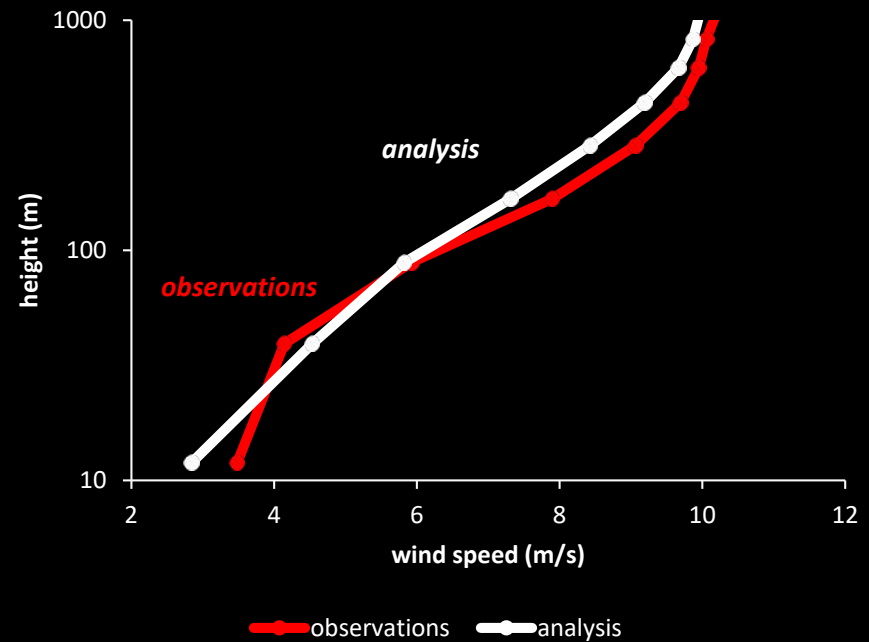

Vertical profile of wind at 60 radiosonde sites: April 2019

HRRR 00Z wind profiles

Consistent with ASOS analysis

HRRR 12Z wind profiles

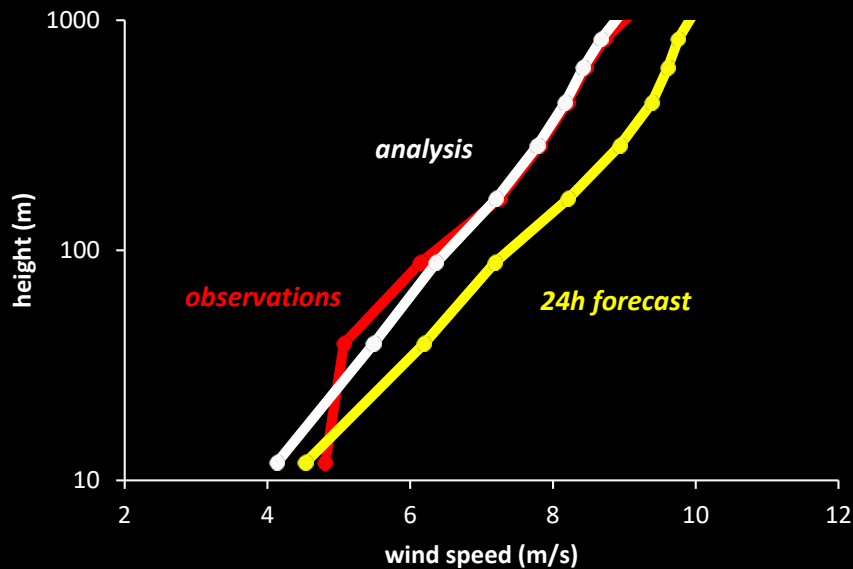

“Kink” in observations is very persistent but may be artifact

**Analysis time wind bias is “small”
[and incorporates these data]**

Vertical profile of wind at 60 radiosonde sites: April 2019

HRRR 00Z wind profiles

—●— observations —●— analysis —●— 24h forecast

HRRR 12Z wind profiles

—●— observations —●— analysis —●— 24h forecast

Compare to 24 h forecasts

Vertical profile of wind at 60 radiosonde sites: April 2019

HRRR 00Z wind profiles

—●— observations —●— analysis —●— 23h forecast

HRRR 12Z wind profiles

—●— observations —●— analysis —●— 23h forecast

Compare to 23 h forecasts

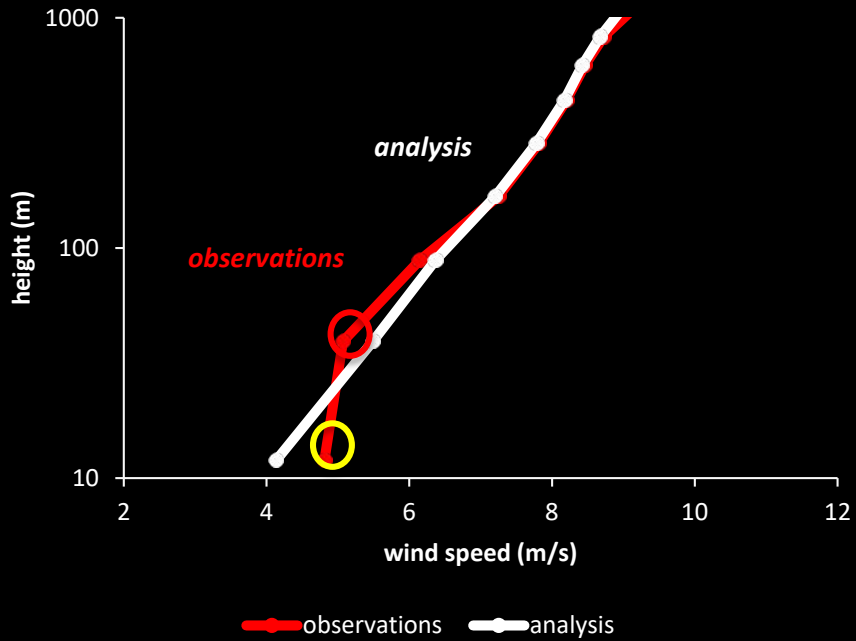

Wind speed bias 00Z

Consistent with ASOS 10m wind bias

Forecast bias vs. height
April 2019

Forecast *bias*: the goal

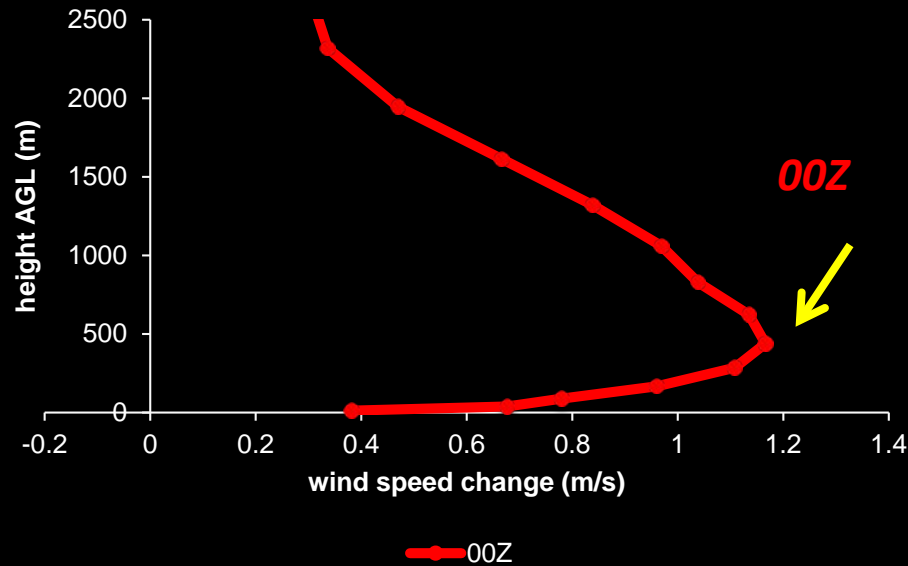

Forecast *drift*: the shortcut

April 2019 24-h forecast drift (60 radiosonde sites)

Wind speed drift: radiosonde sites

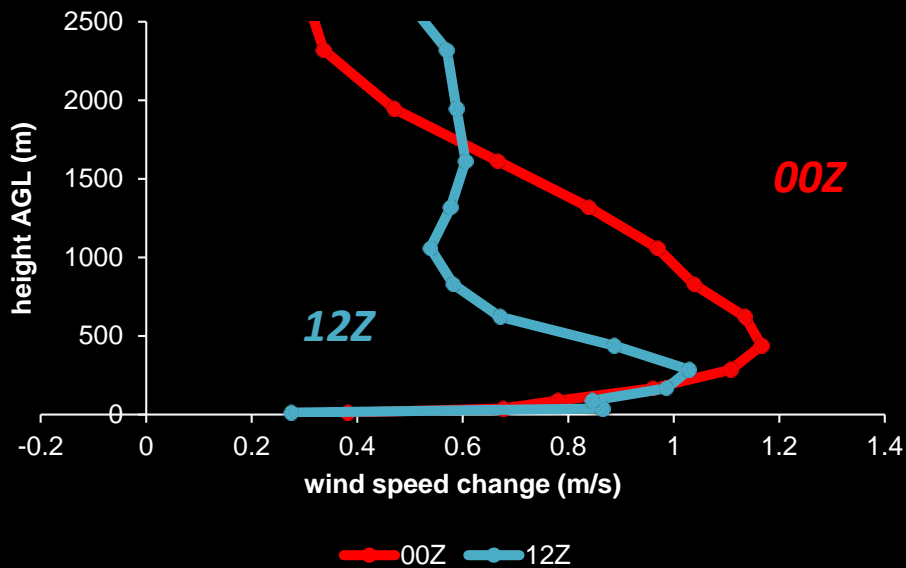

Temperature drift: radiosonde sites

NO OBSERVATIONS DIRECTLY INVOLVED
Height coordinate = average model height AGL

April 2019 24-h forecast drift (60 radiosonde sites)

Wind speed drift: radiosonde sites

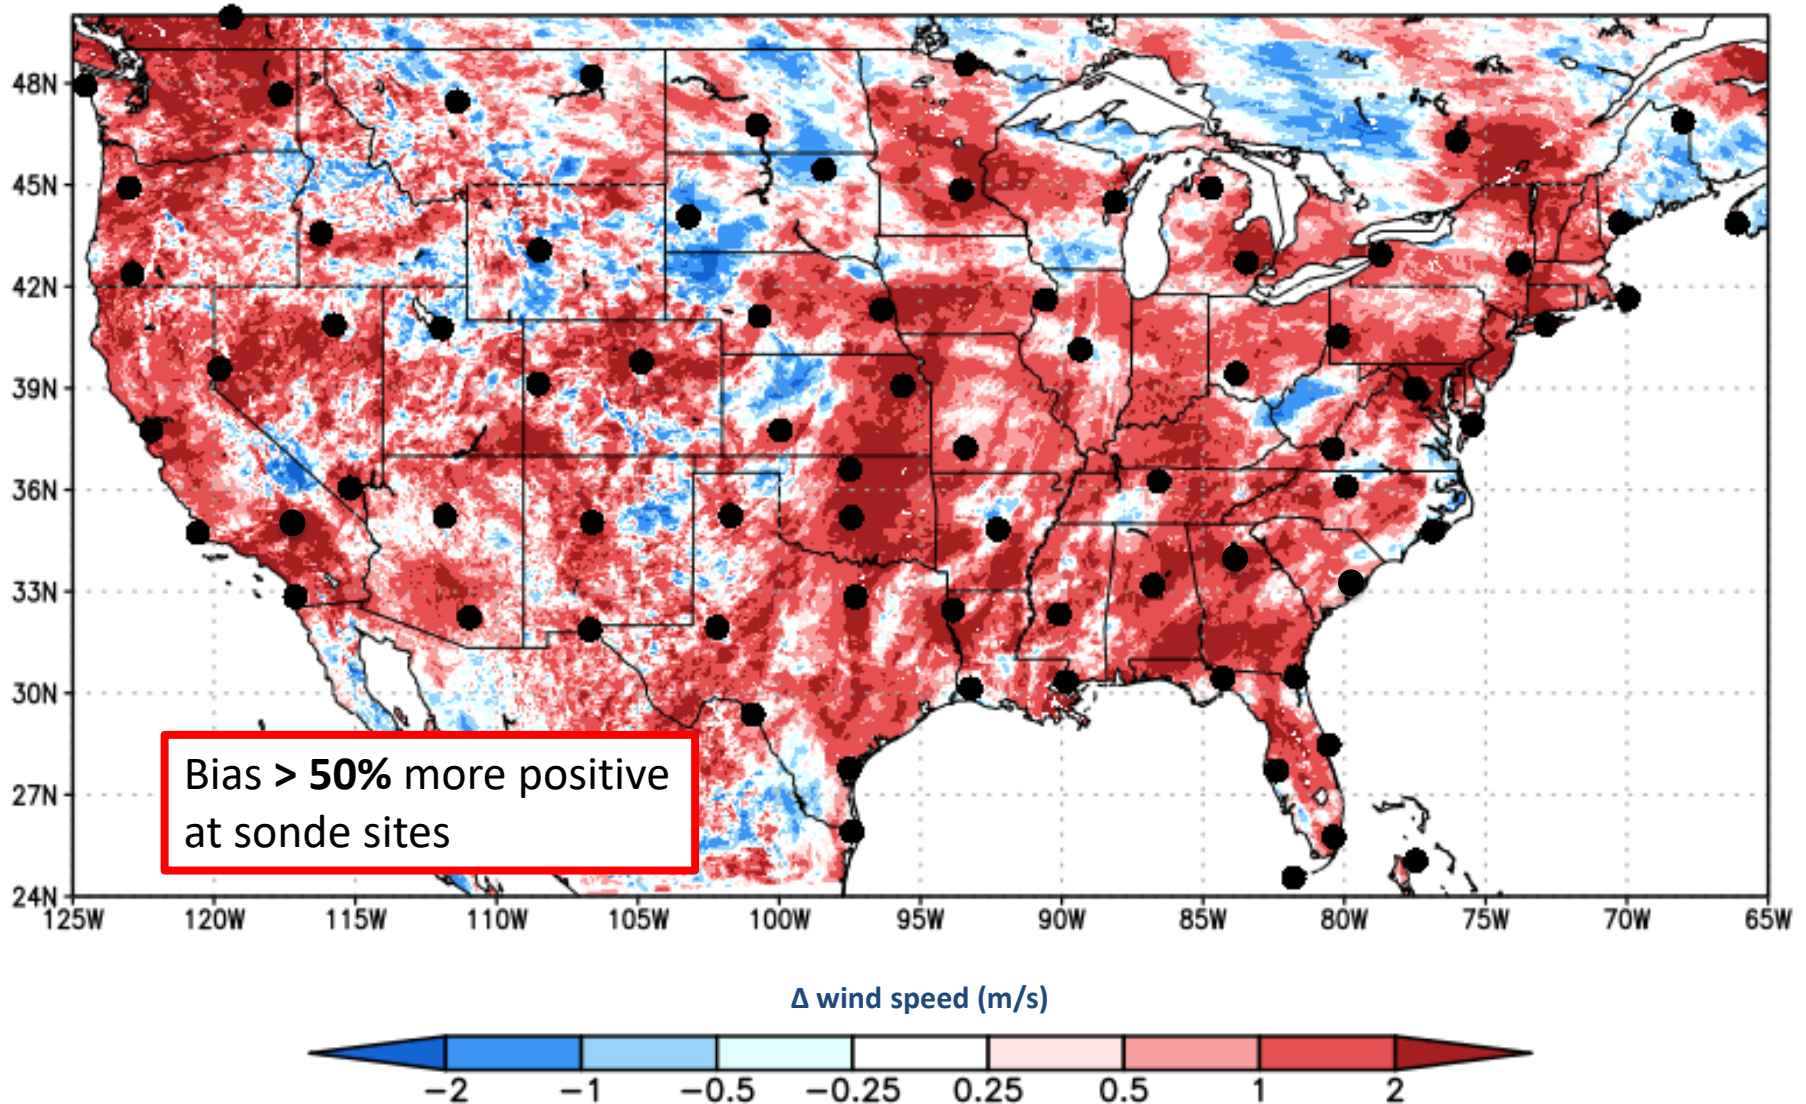

Temperature drift: radiosonde sites

NO OBSERVATIONS DIRECTLY INVOLVED
Height coordinate = average model height AGL

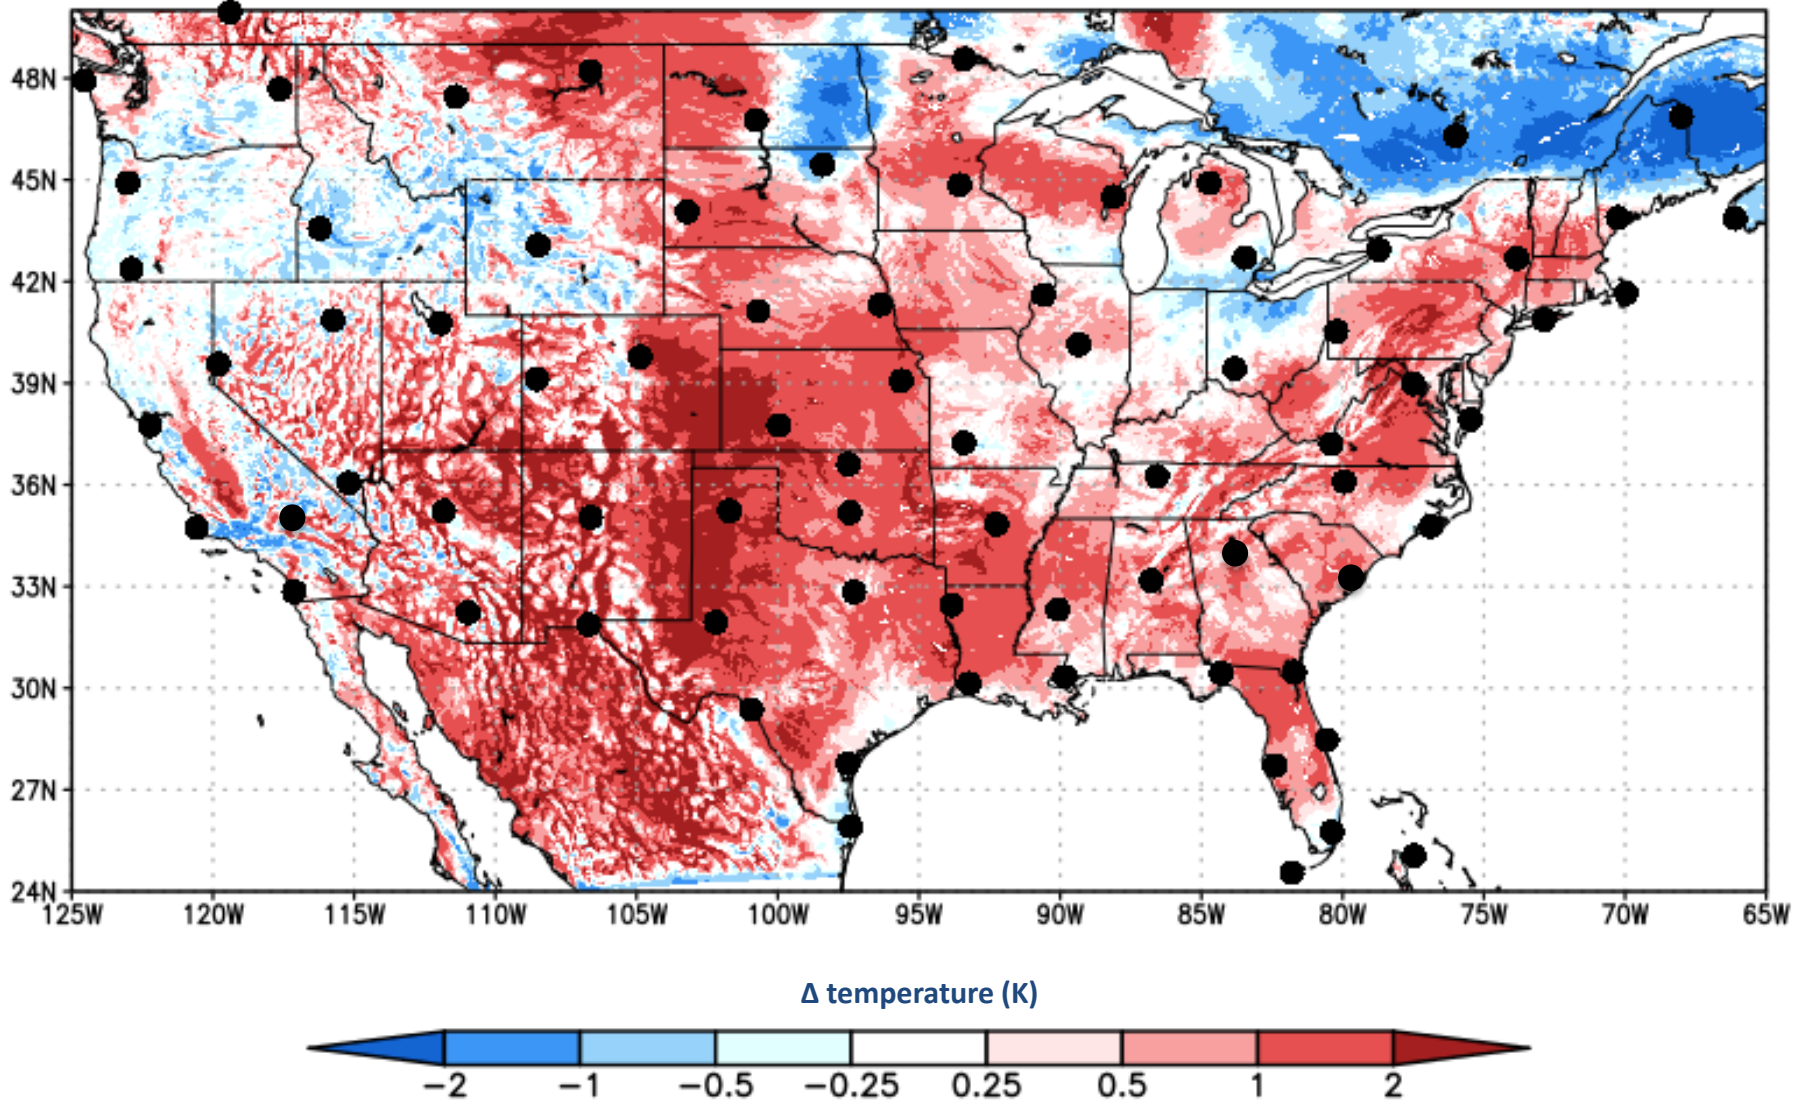

April 2019 ~ 00Z

24-h wind speed forecast drift: model level 6 (~430 m AGL)

April 2019 ~ 12Z

24-h temperature forecast drift: model level 2 (~39 m AGL)

Evolution of forecast drift

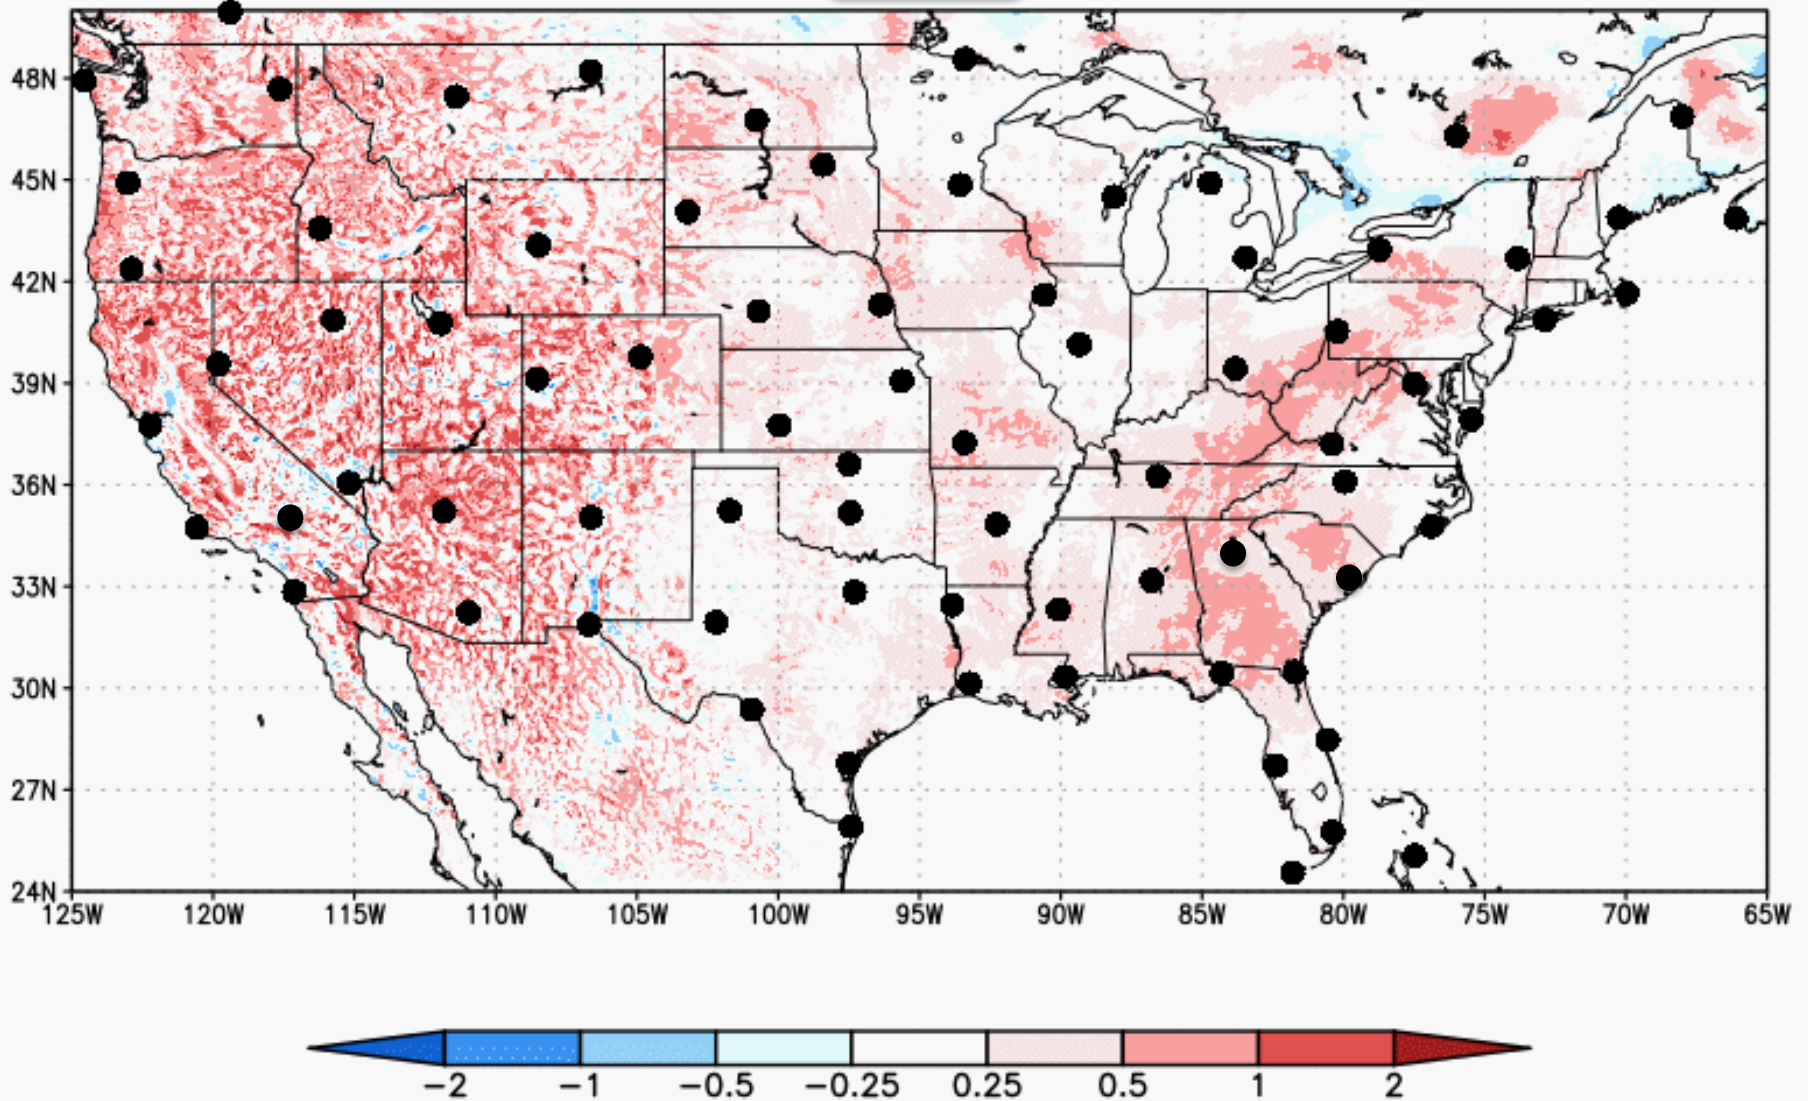

Analysis for all land areas in HRRR
(including outside of CONUS)

June 2019 ~ 12Z

Temperature forecast drift: model level 2 (~39 m AGL)

Jun 2019 12Z 01-h T drift at ML2

12Z forecast drift evolution [April to June 2019]

HRRR 12Z wind f drift: Apr-Jun 2019

HRRR 12Z T f drift: Apr-Jun 2019

1-h drift

From 11Z to 12Z

Over all HRRR land areas

NO OBSERVATIONS DIRECTLY INVOLVED

12Z forecast drift evolution [April to June 2019]

HRRR 12Z wind f drift: Apr-Jun 2019

HRRR 12Z T f drift: Apr-Jun 2019

Up to 6h prior to 12Z

12Z forecast drift evolution [April to June 2019]

HRRR 12Z wind f drift: Apr-Jun 2019

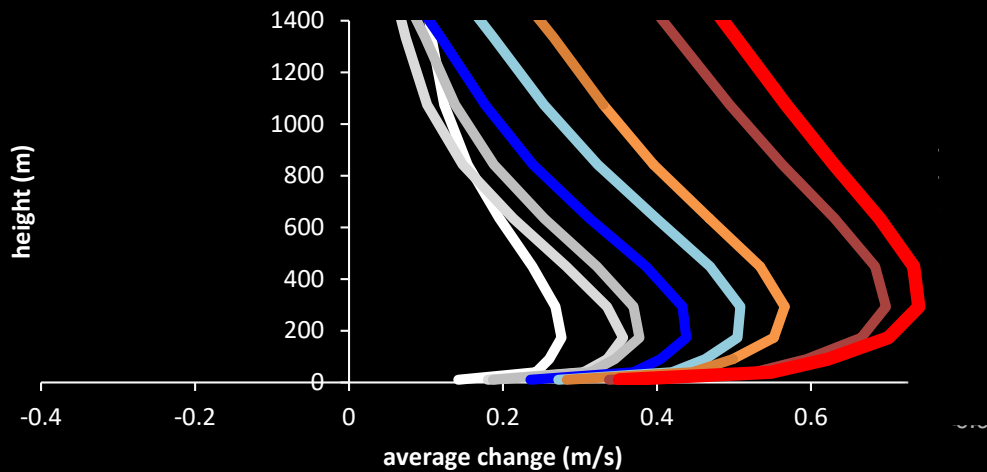

HRRR 12Z T f drift: Apr-Jun 2019

Up to 24h prior to 12Z

00Z forecast drift evolution [April to June 2019]

HRRR 00Z wind f drift: Apr-Jun 2019

HRRR 00Z T f drift: Apr-Jun 2019

**Temperature drift not as pronounced
Wind drift is worse**

Summary

- Boundary layer winds are crucial to many applications but not nearly as well verified
- HRRR 00Z and 12Z analysis have relatively small bias
 - Of course, analyses include radiosonde observations
- Therefore, forecast *drift* reveals information about forecast *bias*, at much lower effort
- Systematic positive wind biases at most heights in the boundary layer
 - Larger at 00Z than 12Z
 - Appear quickly with time
 - Suggestion that radiosonde information not retained long
- Systematic warm biases quickly emerge near surface at 12Z
- Analysis should lead to improvements in boundary layer, surface layer, and land surface parameterizations, among others

[end]

Summary

- 24-h forecast drift April 2019:
 - Wind speed increases both day and night (robust)
 - Nocturnal stability decreases near surface
- Radiosonde comparison indicates **analysis** possesses less bias
- Further analysis suggests fast wind bias emerges quickly & occurs in other months
- Sources of errors/differences: PBL mixing magnitude and depth, surface layer, land surface model, microphysics, clouds & radiation, and larger-scale contributions etc..

HRRR forecast drift: Jan-May 2019

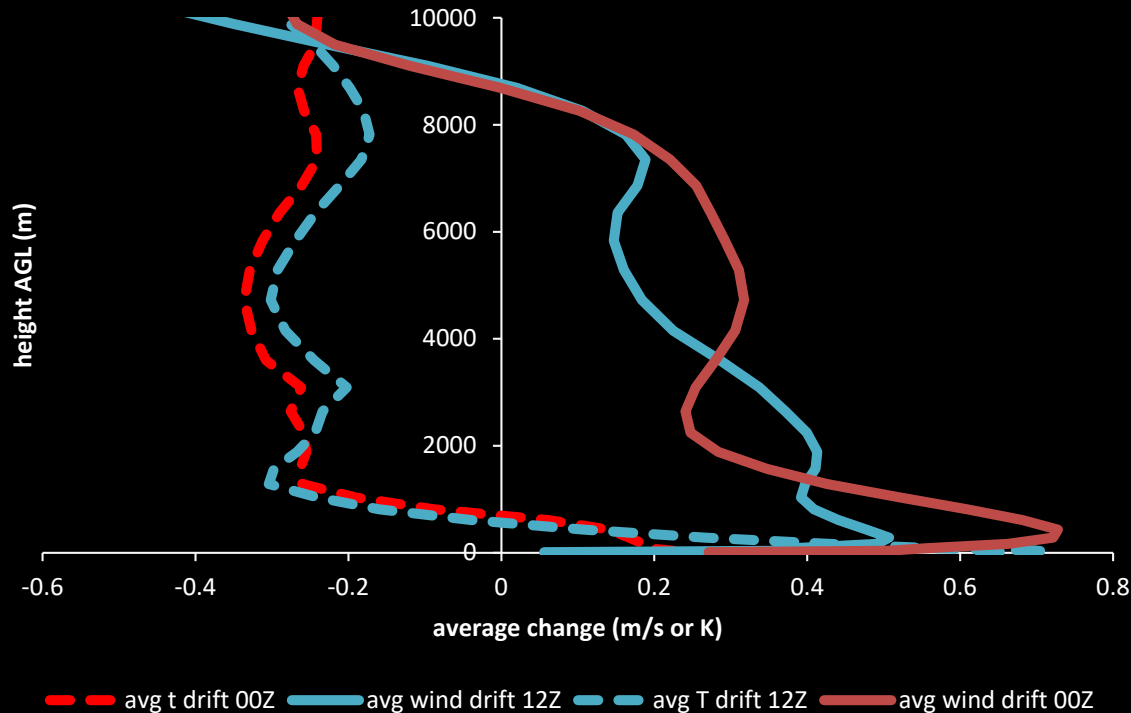

HRRR 24-h forecast drift: Jan-May 2019

**NO OBSERVATIONS DIRECTLY INVOLVED
but analysis bias < forecast bias**

HRRR forecast drift: Jan-May 2019 [over all land areas in model]

HRRR 24-h forecast drift: Jan-May 2019

**NO OBSERVATIONS DIRECTLY INVOLVED
but analysis bias < forecast bias**

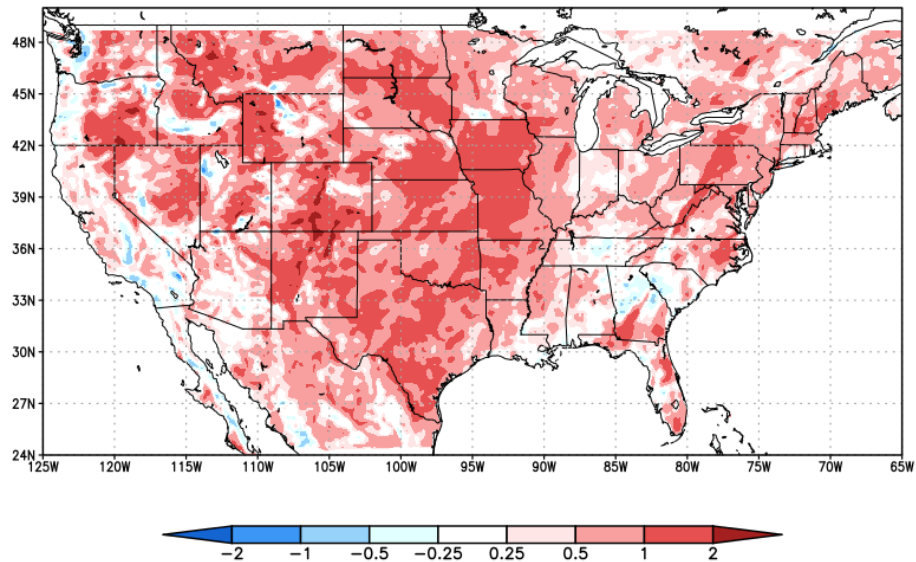

NAM forecast drift: Mar-May 2019

NAM 24h fcst drift over land: Mar-May 2019

NAM data on pressure levels;
Heights are MSL

Near-surface wind speed difference @ 18Z

Limited non-HRRR PBL experiment

Average mixing over land at 18Z

18Z average wind profiles

PBL positive wind bias probably not mixing since it is so deep

Observation height discrepancies

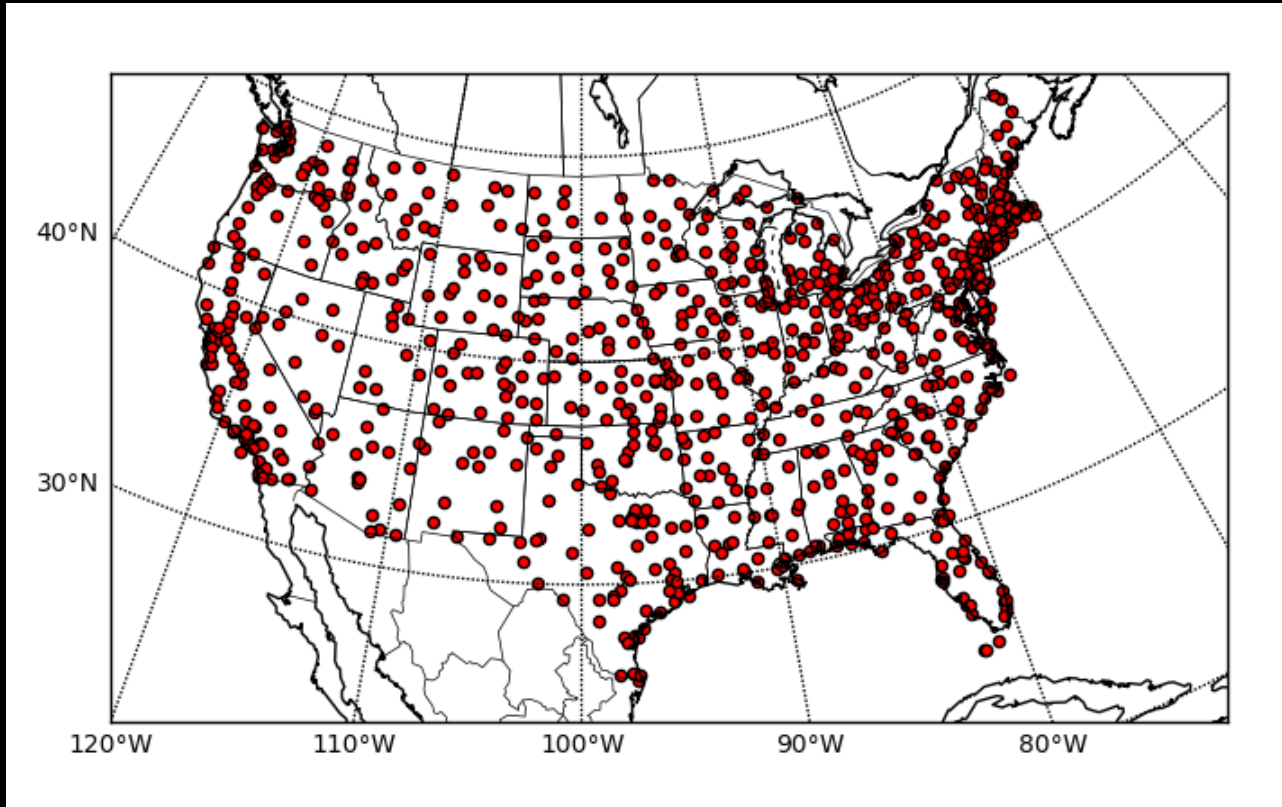

GPS instrument generally gives
lower height estimate

NAM 24h forecast drift over land: May 2019

Available ASOS stations

N > 800

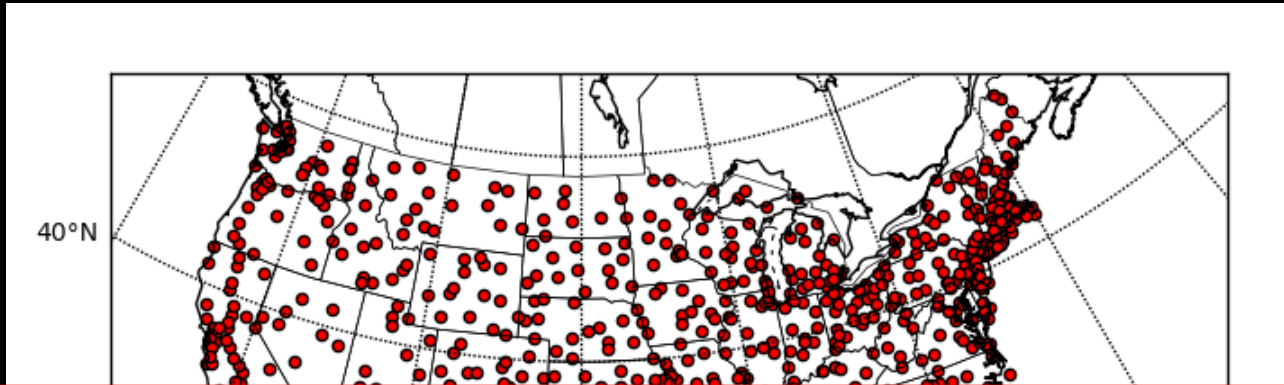

Available ASOS stations

ASOS 10m wind: HRRR 00Z runs
